

DOMAIN NAME ACQUISITION AND MANAGEMENT SYSTEM AND METHOD

Abstract

[0091] A preferred embodiment of the present invention can accept an indication of a domain name or set of domain names from interested entity. The desired domain names are names that an interested entity desires to register through a domain name registration system or systems, such as that operated by a registry-accredited registrar. The system can closely monitor the domain name registry or registrar databases used to provide domain name resolution or registration over a distributed network, such as the Internet, and determine the expiration or availability of the name or names supplied by the interested entity. When a desired domain name appears to be available, the system can register or re-register the domain name through a domain registration service. If there is more than one interested entity for a domain name, the system can also facilitate an auction for the domain name.
